

NEW STANDALONE B2B PRODUCT CONCEPT

ProcurePilot: the AI purchasing co-pilot for small businesses

ProcurePilot turns invoices, quotations, supplier catalogues, online prices, stock levels, and purchasing history into one decision system that recommends what to buy, from whom, when, and in what quantity.

Core promise

“Reduce purchasing cost, avoid stock-outs, and make every supplier decision with evidence.”

Supplier intelligence

Quotation comparison

Invoice analytics

Demand forecasting

AI recommendations

Approvals

ILLUSTRATIVE CUSTOMER OUTCOME

8–15%

Potential purchasing-cost reduction

Driven by unit-cost normalisation, supplier competition, better order timing, quantity optimisation, and leakage detection.

Executive product snapshot

A B2B SaaS concept designed around recurring business purchasing rather than consumer shopping.

£1.2k+

Monthly spend monitored

Micro-business starting point

6–12

Supplier relationships

Typical early customer

30–300

Recurring products

Primary catalogue range

3.4×

Target ROI versus fee

Minimum proven value

How to read the charts: All numeric values are illustrative product-planning assumptions rather than audited market findings. Cartesian charts now identify the horizontal and vertical variables, the unit of measurement, and the direction of a better result.

How each product capability increases customer value

Estimated contribution of each capability to purchasing savings and operational control. Higher scores indicate greater expected customer impact.

X-axis: estimated customer-impact score (0–100) **Y-axis:** ProcurePilot capability

Higher is better

ProcurePilot versus spreadsheet-based procurement across six dimensions

Capability scores range from 0 (very weak) to 10 (very strong). The chart highlights the intended differentiation of the product.

Radial scale: capability score from 0 to 10

Spokes: six differentiation dimensions

The problem worth solving

Small businesses buy repeatedly but often lack procurement systems, supplier analytics, and clean product data.

Target users and buying roles

One shared platform supports the owner, buyer, and branch manager without enterprise-level complexity.

Core end-to-end journey

An unstructured need becomes an evidence-based purchase and measurable result.

1

Capture need

Manual request, low stock, recurring schedule, or forecast.

2

Build requirement

Specification, quantity, deadline, branch, and budget.

3

Collect offers

Supplier quote, catalogue, email, website, or API.

4

Normalise

Product, pack, VAT, shipping, discounts, and terms.

5

Recommend

Supplier, split order, quantity, timing, and risk.

6

Approve & order

Policy check, approval, order, and outcome capture.

How purchasing decision quality improves as the product matures

Illustrative decision-quality score from 0 to 100 across five capability stages.

X-axis: product maturity stage

Y-axis: decision-quality score (0–100)

Higher is better

Estimated procurement cycle time before and after ProcurePilot

Minutes spent at each procurement stage. The comparison shows the expected operational time reduction.

X-axis: procurement stage

Y-axis: estimated time (minutes)

Lower is better

Product modules

Launch narrowly, then grow into a lightweight procurement operating system.

A

Spend & Savings Dashboard

Monitored spend, realised savings, avoided increases, emergency orders, supplier concentration, and budget variance.

B

Business Catalogue

Normalised product master, approved brands, substitutes, units, pack sizes, branch usage, and history.

C

Supplier Hub

Price history, lead time, fulfilment, terms, quality incidents, contacts, and relationship notes.

D

Quotation Inbox

Upload or forward PDFs, images, spreadsheets, and emails; extract line items automatically.

E

Smart Compare

Compare unit cost, landed cost, lead time, reliability, payment terms, and service risk.

F

Basket Optimiser

Recommend one supplier or a split order after delivery thresholds, minimum values, and quantity tiers.

G

Requests & Approvals

Role-based requests, thresholds, comments, budget checks, exception justification, and audit history.

H

Stock & Reorder Signals

Manual stock, CSV, POS, or inventory integrations with reorder points and suggested quantities.

I

Reports & Integrations

Excel/PDF exports, accounting hand-off, supplier APIs, scheduled digests, and webhooks.

Expected adoption of product modules during the first customer year

Number of active intelligence, workflow, and integration modules at each adoption milestone.

X-axis: time after customer onboarding

Y-axis: number of active modules

Shows adoption depth

Product modules ranked by expected customer value

Business-value score from 0 to 100 based on cost savings, time savings, control, and frequency of use.

X-axis: business-value score (0–100)

Y-axis: product module

Higher is better

The ProcurePilot AI engine

AI solves difficult data and decision problems; it is not merely a chatbot layer.

AI capabilities ranked by strategic implementation priority

Priority score from 0 to 100, combining customer impact, feasibility, differentiation, and commercial value.

X-axis: strategic-priority score (0–100)

Y-axis: AI capability

Higher should be built earlier

Example recommendation

“Order 30 units from Supplier B today and 12 from Supplier C next week. This reduces landed cost by £286 while protecting the required delivery date.”

Saving: £286

Confidence: 91%

Risk: low

Valid: 28 hours

Document intelligence

Extract quotation, invoice, receipt, and catalogue data from PDF, image, spreadsheet, or email.

Product entity resolution

Match noisy supplier descriptions to the company catalogue and classify variants with confidence.

Landed-cost normalisation

Compare packs, VAT, delivery, discounts, fees, and payment terms consistently.

Supplier recommendation

Balance cost, fulfilment risk, lead time, quality, and policy constraints.

Demand forecasting

Estimate usage, reorder timing, safety stock, seasonality, and overstock risk.

Anomaly detection

Flag price spikes, duplicate invoices, abnormal quantities, and suspicious discounts.

Alternative discovery

Find equivalent products that satisfy specifications at lower cost or better availability.

Negotiation assistant

Generate supplier negotiation points using price history, volume, alternatives, and service performance.

Procurement analyst

Answer natural-language questions with traceable calculations and source records.

AI processing pipeline

Ingest

Files, APIs, emails, product pages, stock data.

Extract

Products, quantity, price, terms, dates, supplier.

Resolve

Match catalogue identity and pack structure.

Calculate

Landed cost, forecast, budget, constraints.

Recommend

Supplier, timing, quantity, alternatives.

Learn

Corrections, approvals, purchases, and outcomes.

Suggested user experience

Illustrative screens focus on decisions, financial impact, and rapid action.

Data model and architecture

The strategic asset is the purchasing graph connecting products, suppliers, offers, terms, stock, transactions, and outcomes.

SOURCES	INGESTION	AI & DATA	DECISION ENGINE	BUSINESS SERVICES	EXPERIENCE
Supplier quotations	Email forwarding	OCR/parser	Landed-cost engine	Catalogue	Mobile app
Invoices & receipts	File upload	Entity resolution	Basket optimiser	Suppliers	Web console
Marketplace/API data	Connectors	Unit normaliser	Forecast service	Requests	Email/WhatsApp
POS & stock	Refresh scheduler	Price history	Policy engine	Orders	Partner API
ERP/accounting	Validation queue	Supplier graph	Recommendation scorer	Reports & alerts	Admin QA console

Core data entities ranked by their importance to the product moat

Strategic-importance score from 0 to 100 for each entity in the purchasing data model.

X-axis: strategic-importance score Y-axis: data entity Higher contributes more to the moat

Expected improvement in product matching and data completeness after onboarding

Percentage accuracy and field completeness over the first twelve months of use.

X-axis: months after onboarding Y-axis: data-quality percentage Higher is better

Data object	MVP	Phase 2	Phase 3	Advanced
Product master	Full			
Supplier offer	Full			
Quotation document	Basic	Advanced		
Purchase history	Import	Integrated		
Stock & demand	Manual	Integrated		
Approval policy		Basic	Advanced	
Supplier risk			Pilot	Advanced

Business model

Pricing aligns with products, users, spend, automation, refresh frequency, and integrations.

Free 1 user, 20 products, 2 suppliers, manual uploads, monthly report.	Starter — £39/mo 100 products, 5 suppliers, alerts, basic extraction, and savings dashboard.	Team — £99/mo 500 products, 10 users, approvals, branches, basket optimisation, and reports.	Growth — £249/mo 2,000 products, integrations, advanced AI, API, custom policies, and priority support.
--	--	--	---

Expected recurring revenue mix after the product reaches scale Percentage contribution of subscriptions, APIs, partners, and premium services to total revenue. Measure: percentage share of total revenue Segments: revenue source Total equals 100%	Estimated monthly customer value compared with the subscription fee Monthly amounts in pounds sterling. A wider gap indicates a stronger customer return on investment. X-axis: subscription plan Y-axis: monthly amount (£) Greater value-to-fee gap is better
--	--

Pricing principle: the subscription should be traceable to verified savings, avoided increases, reduced emergency buying, or time saved.

Go-to-market strategy

Win one repeat-purchase vertical first, deliver a concierge pilot, then productise the repeated workflows.

Initial wedge

Cleaning, hygiene, office, café packaging, and recurring consumables with standard units and repeat demand.

Acquisition channel

Accountants, POS providers, SME communities, wholesalers, industry associations, and targeted outbound.

Proof mechanism

A free spend review identifies concrete saving opportunities before subscription.

Go-to-market channels ranked by expected acquisition effectiveness

Channel-attractiveness score from 0 to 100 based on trust, access, cost, conversion potential, and scalability.

X-axis: channel-attractiveness score (0–100) **Y-axis:** acquisition channel

Higher is more attractive

Illustrative customer acquisition funnel from lead to account expansion

Number of businesses expected to remain at each commercial stage from an initial pool of 100 leads.

X-axis: commercial funnel stage

Y-axis: number of businesses

Shows conversion drop-off

1. Spend review

Upload invoices or a product list.

2. Savings report

Show leakage and alternatives.

3. Pilot

Track 30–100 products.

4. Subscription

Convert after verified action.

5. Expansion

Add users, branches, and integrations.

KPIs and unit economics

The north-star metric connects usage to verified purchasing value.

North-star metric: verified savings and cost avoidance generated per active business per month.

Product roadmap

Sequence the work around trustworthy data, measurable savings, workflow adoption, and integration depth.

●

Phase 0 — Concierge validation

Manual comparison for 5–10 businesses, sample invoice analysis, supplier mapping, and weekly savings report.

●

Phase 1 — Intelligence MVP

Catalogue, suppliers, quotation upload, matching, normalisation, compare, history, alerts, and savings dashboard.

●

Phase 2 — Team workflow

Requests, approvals, branches, budgets, supplier performance, basket optimisation, and scheduled reporting.

●

Phase 3 — Connected operations

POS, inventory, accounting, ERP, email ingestion, order tracking, and reconciliation.

●

Phase 4 — Predictive procurement

Forecasting, negotiation intelligence, automated sourcing, supplier risk, and autonomous recommendations.

MVP must include

- Catalogue and supplier master.
- Quotation and invoice upload.
- Product matching and normalisation.
- Last-paid and market comparison.

- Price history and alerts.
- Supplier offer comparison.
- Basic basket optimisation.
- Savings dashboard and export.
- Arabic/English-ready localisation.

How customer value, defensibility, and implementation complexity evolve

Maturity score from 0 to 100 across the validation, MVP, workflow, connected-operations, and predictive phases.

X-axis: product roadmap phase

Y-axis: maturity score (0–100)

Compare value, defensibility, and complexity

Delay until later

- Open supplier marketplace.
- Autonomous ordering.
- Strategic sourcing suite.

- Contract lifecycle management.
- Seller repricing.
- Heavy enterprise customisation.
- Social features and public reviews.

Key risks and mitigations

Product trust depends on reliable data and disciplined scope.

Final product blueprint

Sell purchasing intelligence and operating control—not generic comparison software.

ProcurePilot is an AI procurement operating system for small businesses. It converts fragmented quotations, supplier prices, invoices, stock signals, and purchasing history into normalised comparisons, recommended orders, approval-ready decisions, and verified savings.

Primary moat

A clean purchasing graph linking products, suppliers, prices, terms, quantities, stock, transactions, and outcomes.

Commercial proof

Verified monthly savings and cost avoidance greater than the subscription fee.

Launch strategy

One recurring-consumables vertical, concierge pilot, narrow MVP, then workflow and integration expansion.

Strategic factors ranked by their importance to product success

Relative strategic-importance score from 0 to 100 for the five factors that determine sustainable product value.

X-axis: strategic-importance score (0–100) **Y-axis:** success factor

Higher is more important

Why this idea is robust

- Solves a recurring and measurable business problem.
- Creates value before deep ERP integration.
- Uses AI for difficult product and document data.
- Links analytics to approval and purchasing actions.
- Supports clear subscription ROI.
- Can expand from intelligence into workflow and automation.

ProcurePilot concept report — self-contained HTML with embedded CSS, JavaScript, illustrations, and interactive charts. Financial figures are illustrative and shown in GBP.
